## EQUIPMENT FOR CAPPING BOTTLES

---

This equipment will apply ROPP: Roll On Pilfer Proof caps  
These are the type of caps most oil producers use, they are similar to the caps now found on most wine bottles but have an integral oil pourer.

### Semi auto cappers

This machines will roll threads and crimp caps onto bottles. The cap is placed loosely onto the bottle and the bottle placed on the platform.

For the lever pull machine: Left hand presses the button to start the head rotation and the right pulls back the lever against the stop and releases.

*Guide price: £2,950 +VAT*

For the push button machine: Simply press and release buttons to complete the capping operation. Less tiring than the lever machine and a little faster.

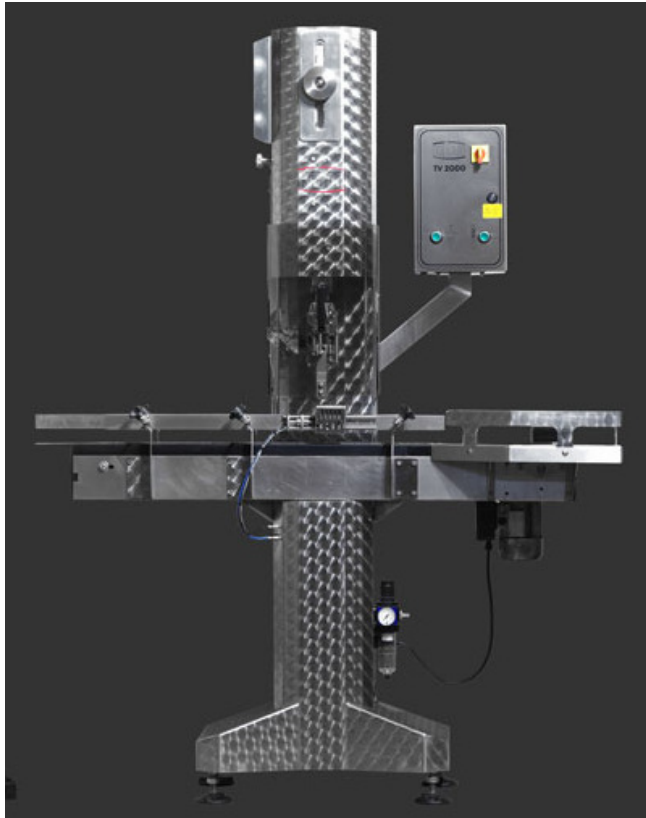

*Guide price: £3,930 +VAT*

Can accommodate various bottle sizes since most bottle designs use the same neck for each size (e.g. 250ml, 500ml and 750ml). The head can be changed by the operator for different thread sizes should that be required.

## **Automatic capping machines**

These machines greatly speed up capping since they dispense the cap automatically. Simply place the filled bottle onto the conveyor and it is moved forward to where the cap is dispensed and then to the capping station where the cap is sealed onto the bottle. Bottles are collected on a tray or a rotary table which can hold over 100 bottles. The capper can be joined to a conveyor labeller so that capping and labelling can be performed automatically.

Prices start around £13,000

(Shown here without the cap dispenser)
