EQUIPMENT FOR FILLING BOTTLES

Vacuum fillers

These bottle fillers use an internal vacuum pump to suck air from the bottle being filled so that air pressure pushes the oil from a tank or drum into the bottle. They are very good at filling bottles to the exact same height every time.

These fillers are very easy to use; simply push the bottle under the spring loaded nozzle and it will be filled to the set level.

Options are available for small bottles, narrow necks, jars, and large containers to 5 litre.

The small single head bench-top **enolmatic** can fill around 400 of 250ml bottle per hour. The 4 head **enolmaster** can fill well over 1,000 bottles per hour. With the four head machine there is usually at least one full bottle ready to remove (as a new empty is presented to the machine the others are filling or full) making down stream capping and labelling faster too.

NOTE: being vacuum fillers they will only fill glass or rigid plastic bottles. They will not fill, for example, 5 litre plastic containers.

Enolmatic single head machine, guide price: £280 + VAT

Enolmaster 4 head machine, guide price: £1,600 + VAT

Single head enolmatic

4 head enolmaster

Filler for larger containers (including soft plastic jerrycan type)

This air operated filler is ideal for fast filling of larger containers including non-rigid plastic HDPE containers. All parts in contact with oil are food grade.

Speed of fill and quantity are both variable

Can fill from 250ml to 5 litre in one stroke.

The filler draws oil from a tank (that can be below the unit) and dispenses directly into the container.

*Guide price: £2,600 + VAT
Bag in box option : £3,700 + VAT*
